HIATUS COFFEE · DEMO GUIDE · COLLAB 2026

MY ASSIGNED FEATURES

Step-by-step instructions to show each of my five features working. Every step says what to do and what you should see, so you can follow it during the presentation.

THE FIVE FEATURES

C-005	View and update profile information	READY	Page 2
C-010	Track order status in real time	READY	Page 3
C-007	View order history	READY	Page 4
C-004	Log out of the application	READY	Page 4
C-003	Reset a forgotten password	NEEDS SERVER ROUTES	Page 5

Show them in this order: it tells one story — update your details, order a drink and watch it, see it in your history, log out, then recover a forgotten password.

BEFORE YOU START

1. Start the system

- [ ] Terminal 1: `cd server` then `npm run dev` (the Express server).
- [ ] Terminal 2: `cd HIATUS` then `npm run dev` (the website).
- [ ] `HIATUS/.env.local` exists (copied from `.env.local.example`) and its `JWT_SECRET` is the same as in `server/.env`.
- [ ] Open `http://localhost:3000` and check it loads.

2. Prepare the accounts

- [ ] A **customer** account whose email inbox you can open on screen (needed for C-003).
- [ ] A **staff** account (needed for C-010 and C-007).
- [ ] The customer already has **one completed order**, so the order history isn't empty.

3. Arrange the screen

- [ ] `CUSTOMER` a normal Chrome window, logged in as the customer.
- [ ] `STAFF` a Chrome **Incognito** window (`Ctrl+Shift+N`), logged in as staff. Separate windows keep the two logins apart.
- [ ] Put the windows side by side and turn the volume up.

C-005 VIEW AND UPDATE PROFILE

READY

WHAT IT SHOWS

A customer can see their account details and change them.

WHERE

Header → Account (the `/profile` page)

	DO THIS	YOU SHOULD SEE
1	CUSTOMER Click Account in the header.	The profile page with **Your details**: full name, phone number and email.
2	CUSTOMER Change the **phone number** (e.g. add a digit).	The field shows the new number.
3	CUSTOMER Click Save changes.	A green **"Saved."** message.
4	CUSTOMER Reload the page (`F5`).	The new phone number is still there — it was saved on the server, not just on screen.

Say: "Customers keep their name and phone up to date, so the counter can call their order and reach them."

If something goes wrong

Profile says "Couldn't load profile"	The server isn't running, or the customer isn't logged in.
Phone number won't save	Phone numbers must contain digits only — remove spaces or dashes.

C-010 TRACK ORDER STATUS IN REAL TIME

READY

WHAT IT SHOWS
The customer watches their order move through each stage without refreshing the page.

WHERE
The order's page (`/orders/…`) and the staff Queue

	DO THIS	YOU SHOULD SEE
1	CUSTOMER Add a drink to the cart, go to checkout and place the order.	The order page opens. Status: **Received**, with a progress bar and a wait estimate.
2	CUSTOMER Click once anywhere on the order page.	Nothing visible — this only lets the browser play the alert sound.
3	STAFF Open Queue, find the order, click Start making.	Within about 20 seconds, the customer's page moves to **Making** by itself, with a pop-up and a chime.
4	STAFF Click Mark ready.	The customer's page moves to **Ready** and an **"Order ready!"** window appears with the order code.
5	CUSTOMER Click Got it.	The window closes; the page shows **Ready** and tells them to come to the counter.

Wait up to 20 seconds after each staff click — that's how often the page checks for updates. Use the pause to explain what's happening.

Say: "The customer never refreshes. The page checks for changes every 20 seconds, so they always know where their drink is."

If something goes wrong

The page doesn't change after 20 seconds	Make sure staff clicked the right order. Check the server terminal for errors.
No pop-up or sound	Click once on the customer's page first. In **Account** → **Notifications**, tick both boxes and save.

C-007 VIEW ORDER HISTORY

READY

WHAT IT SHOWS
A customer sees every order they've placed, and can open any of them.

WHERE
Header → Orders (the `/orders` page)

1

DO THIS
STAFF Finish the order from C-010: take payment if the ticket asks for it, then click Hand over.

YOU SHOULD SEE
The order leaves the staff queue.

2

DO THIS
CUSTOMER Click Orders in the header.

YOU SHOULD SEE
A list of all past orders with date, total and status — the new one at the top, marked collected.

3

DO THIS
CUSTOMER Click any order in the list.

YOU SHOULD SEE
That order's page, with the full **Receipt**: each drink, size and price, and the total.

> **Say:** "Every order is kept, so customers can check what they had and what they paid."

C-004 LOG OUT

READY

WHAT IT SHOWS
A customer can sign out, and their pages are protected afterwards.

WHERE
Header → Sign out (on a phone: the menu ☰)

1

DO THIS
CUSTOMER Click Sign out in the header.

YOU SHOULD SEE
The login page. The header now shows **Log in** and **Sign up**.

2

DO THIS
CUSTOMER Type `localhost:3000/orders` in the address bar and press Enter.

YOU SHOULD SEE
Sent back to the **login page** — order history can't be seen after logging out.

> **Say:** "Logging out really ends the session — someone using the same computer afterwards can't see this person's orders."

C-003 RESET A FORGOTTEN PASSWORD

NEEDS SERVER ROUTES

WHAT IT SHOWS
A customer who forgot their password gets an email link and sets a new one.

WHERE
Login page → Forgot your password?

Check first: the email part runs on the Express server. It only works once the routes in `docs/password-reset-backend.md` are added to the server. If they aren't, use **Plan B** below.

	DO THIS	YOU SHOULD SEE
1	On the login page, click Forgot your password?	The **Reset your password** page asking for an email.
2	Type the customer's email and click Send reset link.	**Check your email** — "If that address has an account with us, a link … is on its way. It expires in an hour."
3	Open the customer's inbox and the email **"Reset your Hiatus password"**. Click the link.	The **Set a new password** page.
4	Type a new password (at least 8 characters) in both boxes and submit.	**Password changed** and a Log in button.
5	Click Log in and sign in with the new password.	Logged in successfully. (The old password no longer works.)
6	Go back to the email and click the same link again.	"This reset link has expired or was already used." — each link works **only once**.

Say: "The page gives the same answer for any email, so nobody can use it to find out who has an account. Links expire after an hour and only work once."

Plan B — if the server routes aren't added yet

	DO THIS	YOU SHOULD SEE
1	Do steps 1–2 above.	"Password reset by email isn't available yet. Ask at the counter and we'll reset it for you."
2	Explain it.	"The website side is finished and tested. The email sending is on the server, and the setup guide is ready in `docs/password-reset-backend.md`."

If something goes wrong

No email arrives	Check the **spam** folder. Make sure the server's `SMTP_` settings are filled in.
"Too many reset requests"	Wait one minute — the server allows one request per minute per email.
"This reset link has expired" on the first try	The link is over an hour old, or a newer one was requested. Ask for a new link.

JUST BEFORE PRESENTING

- [ ] Both terminals running; `localhost:3000` loads.
- [ ] Customer and staff logged in, in separate windows, side by side.
- [ ] Volume up; clicked once on the customer page.
- [ ] One completed order already in the customer's history.
- [ ] Customer's email inbox open in another tab (for C-003).
- [ ] Did one full practice run, so pages load quickly (the first load of each page is slow).
